                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (26-DEC-2001) Whitehead Institute/MIT Center Research, 320 Charles Street, Cambridge, MA 02141, USA All repeats were identified using RepeatMasker: Smit, A.F. A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This record contains 79 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.
                                                                                                Length 37784;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Web site: http://www-seq.wi.mit.edu

Sequence 386, Application US/09060756

Patent No. 6183957

GENERAL INFORMATION:

APPLICANT: Cole, Stewart

APPLICANT: Gordon, Stephen

APPLICANT: Billault, Alain

TITLE OF INVENTION: HE GENOME OF A MYCOBACTERIUM USING A BAC-BASED DNA

TITLE OF INVENTION: LIBRARY APPLICATION TO THE DETECTION OF MYCOBACTERIA

TITLE OF INVENTION: LIBRARY APPLICATION TO THE DETECTION OF MYCOBACTERIA

CURRENT APPLICATON UNMBER: US/09/060,756

CURRENT FILING DATE: 1998-04-16

NUMBER OF SEQ ID NOS: 743

SEQ ID NO 386

LENTH: 287

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 122, Application US/08592541
Sequence 122, Application US/08592541
Patent No. 598054
GENERAL INFORMATION:
APPLICANT: ROMBINS, JOHANNA M
APPLICANT: ROMBINS, JOHANNA M
APPLICANT: FRASE, PAUL E
TITLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED
TITLE OF INVENTION: TO ALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 183
CORRESPONDENCE ADDRESS:
ADDRESSEE: TESTA, HURWITZ & THIBEAULT
CORRESPONDENCE ADDRESS:
US-08-967-101-122
Sequence 122, Application US/08967101
Patent No. 5840540

Patent No. 6194153

GENERAL INFORMATION:
APPLICANT: ST GEORGE-HYSLOP, PETER H
APPLICANT: ROWMENS, JOHANNA M
APPLICANT: REASER, PAUL E
TITLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED
TITLE OF INVENTION: TO ALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 183
CORRESPONDENCES: 183
CORRESPONDENCE ADDRESS:
STREET: High Street Tower - 125 High Street
                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TITLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED TO ALZHEIMER'S DISEASE NUMBER OF SEQUENCES: 175
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 1.5%; Score 16; DB 4; Length 440; Best Local Similarity 100.0%; Pred. Patent No. 6117978

GENERAL INFORMATION:
APPLICANT: ST. GENGE-HYSLOP, PETER H
APPLICANT: ROMMENS, JOHANNA M
APPLICANT: ROMMENS, JOHANNA M
TITLE OF INVENTION: TO ALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 183
CORRESPONDENCE ADDRESS:
ADDRESSEE: HAJA Street Tower - 125 High Street
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             APPLICANT: ST.                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 7, Application US/08496841C

Patent No. 6210919
GENERAL INPORMATION:
GENGE-HYSLOP, PETER H
ROMMENS, JOHANNA M
FRASER, PAUL E
TITLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED
TO ALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 175
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             COMPUTER READABLE FORM:

  The sequence contained an oligo-dr track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NoLI site and the oligo-dr track served to identify it as a clone from the normalized corpus-striatum library cDNA Library Preparation: M.B.    The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful for diagnosing and treating diseases or conditions mediated by human proteins are sequences of the invention are useful.

Co diagnosing and treating diseases or conditions mediated by human proteins are sequences of conditions mediated by human ce groundly and protein in inflammatory disorders.

Ce.g. hyperplasia), neurological disorders (e.g. parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders or e.g. adult respiratory disorders or distress syndrome, ARDS). The GPCR protein is also useful for identifying a modulator of the expression of the protein. It also serves as a target for identifying agents for use in mammalian therapeutic applications, ce.g. a human drug, particularly modulating a biological or pathological response in a cell or tissue that expresses the protein, in biological response in a cell or tissue that expresses the protein, in biological sequence related to GPCRs that are related to members of the chemokine receptor subfamily, in drug screening assays and in competition binding assays. GPCR is also useful in diagnosing a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic analysis. The control of the novel human GPCR of the invention.
   ö
  Novel human G-protein coupled receptor proteins and nucleic acid molecules encoding the protein for use in developing human therapeutics and diagnostic compositions and for identifying modulators of the

   hRUP19 The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Mon-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilized to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
  Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -

   The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

28, 31-38, 40, 41, 53-60) and their coding sequences. The present

sequence is the coding sequence for one such G protein-coupled receptor.

GPCRs are also known as seven transmembrane receptors and function in

signal transduction. The nGPCRx coding sequences are useful for

screening a human to diagnose a disorder affecting the brain or a genetic

c predisposition, specifically schizophrenia. nGPCRx are useful for

cneptRx in a sample is useful for treating schizophrenia. Detection of

cneptRx in a sample is useful for treating schizophrenia. Detection of

clasorders infections such as HIV-1, metabolic and cardiovascular

clasorders, infections such as HIV-1, metabolic and cardiovascular

clasorace; proliferative disorders and hormonal disorders. Modulators of

nGPCRx activity have the utility for treating neurological disorders,

clasorace; proliferative disorder), and neuronal disorders such as

clasorace; apprintment of disorder), and neuronal disorders such as

clasorace; rheumatoid arthritis, autoimmune disorders, cancers,

conditional disorders include inflammatory conditions (e.g. Crohn's

crespiratory aliments auch as asthma, and inflammatory diseases e.g.

New human G-protein coupled receptor X, GPCRX, polypeptide useful in treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists and agonists useful therapeutically SK; Spaderna S Li L; ŗ, Wolenc AR, Spytek KA, Vernet CAM, Casman SJ, Mishnu VS, Tchernev VT, 11-AUG-2000; 2000US-224588P. 11-CCT-2000; 2000US-236513P. 18-JAN-2001; 2001US-262508P. 23-JAN-2001; 2001US-263604P. 23-JAN-2001; 2001US-263604P. 30-JAN-2001; 2001US-265161P. 2000US-219855P. 2000US-221284P. 2000US-221325P. 2000US-195068P. 2000US-195069P. 2000US-195070P. 2000US-195066P. 2000US-195067P. 2001US-265161P 2001US-0823172 30-MAR-2001; 2001WO-US10241 2000US-195510P Baumgartner JC, Gusev VY;

The invention relates to nucleic acid sequences (ABAB1529-ABAB152) that encode G-coupled protein-receptor related polypeptides

(ABB44527-ABB44543). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid captures forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the specification and corresponding to human G-protein coupled receptor X (GPCRX) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The polypeptides can be administered therapeutically, especially using gene polypeptides can be administered therapeutically, especially using gene compared to stand an expressing and mercoding DNA in vivo, to treat or prevent GPCRX-associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders compession and metabolic pathway modulation (e.g. disease, multiple solesity, anorexia), diabetes, osteoporosis, crohn's disease, multiple calerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's diseases, Parkinson's disorder, Huntington's disease, immune disorders, hadmatopoietic disorders, developmental diseases, immune disorders, conferently, fungal, protozoal and viral infections (e.g. with humans) by detecting alterations in polypeptide expression levels relative to control samples. They are useful to identify agents binding polypeptide control samples they are useful to identify agents binding polypeptide control and equivation or activity, useful as modulating callular polypeptide expression or activity, useful as modulating callular polypeptide expression or activity, useful as Claim 9; Page 7; 157pp; English

The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful for diagnosing and treating diseases or conditions mediated by human proteases. Such diseases include hyperproliferative disorders (e.g. hyperplasia), neurological disorders (e.g. Parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders (e.g. diabetes) and respiratory disorders (e.g. diabetes) and respiratory disorders (e.g. also useful for identifying a modulator of the expression of the protein is also useful for identifying agents for use in mammalian therapeutic applications, e.g. a human drug, particularly modulating a blological or pathological response in a cell or tissue that expresses the protein, in biological creeptor subfamily, in drug screening assays and in competition binding assays and screening assays and in competition binding assays. GPCR is also useful in diagnosing a disease or predisposition to polynocleotide sequences can also be used in gene thersent
   molecules encoding the protein for use in developing human therapeutics and diagnostic compositions and for identifying modulators of the

New G protein-coupled receptor (nGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia

The present invention retarces to novel to protein couplete incuples. The present invention retarces to novel to protein couplete incuples. 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present consists are also known as seven transmembrane receptors and function in captured in the coding sequence and function in captured in the coding sequence are useful for captured in a sequence and function in captured in a predisposition. The nGPCRx coding sequences are useful for captured in a predisposition, specifically schizophrenia nGPCRx are useful for deanness a disorder affecting the brain or a genetic conformation of nGPCRx in a sample is useful as a diagnostic tool for diseases or disorders, infections such as HIV-1, metabolic and cardiovascular disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of cofPCRx activity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit disorder), and neuronal disorders such as include inflammatory conditions (e.g. Crohn's disease), rheumatolid arthritis, autolymmune disorders, cancers, concers, co present invention relates to novel G protein-coupled receptors

inflammatory bowel disease.

The present sequence encodes a member of the G-protein coupled receptor (7TM receptor) family, designated the HM/4A receptor. The proteins, agonists, antagonists and polynucleotides can be used for treating disorders associated with increased or reduced expression or activity of HM/4A, e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, clabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia manic depression, depression, delitium, dementia, and severe mental retardation, and dyskinesias such as Huntington's disease or cetardation, and dyskinesias such as Huntington's disease or cetardation, and dyskinesias such as Huntington's disease or cetardation.

The sequence encodes a human G-protein coupled receptor (GPCR), hRUP25. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90677 and AAY90677 and AAA30709-A30743 and AAA30779-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous anno acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Promay be endogenous. Anno-endogenous, or a mixture of endogenous and con-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful for identifying antagonists. The mutant proteins are also useful for settings for elucidating the roles of the receptors in normal and discassed conditions. Antagonists for a particular GPCR are useful for reacting diseases and discreders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous in an exemplification of the invention. This was cloned and subjected unstant of the invention.

AAY30677 and AAY30683-Y90687), and to DNA encoling them (AAA30709-A30743) and AAA30775-A30779). The mutant protein coupled receptors (GPCRS, AAY30687), and to DNA encoling them (AAA30709-A30743) and tanament protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous residue in IC3 at a position of amino acids N-terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Promay be endogenous, non-endogenous, or a mixture of endogenous and manaceutical agents. The mutant proteins are also useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research settings for elucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively acitive, they can be used directly for screening of compounds without the need for endogenous ligands. Sequences AAA30709-AAA30743 and AAA30779 represent DNAs

  Consensus sequences are identified from nine rat gene receptors. The receptors are for somatostatin, substance K, substance P, neuromedin K, thyrotropin, HH/CG and others designated mas, mry and rta. Four regions of nucleotide sequence are found to exhibit a degree of conservation significant enough to design degenerate oligo primers for PCR (see AAQ55045-49). Five oligos are designed with 4 - to 64-fold direct degeneracy plus 5%-23% inosines. The oligos are designed to anneal sequences in G protein-linked peptide receptor genes. They are used as six different primer pairs for PCR using rat genomic DNA

size. DNA fragments are cloned and two samples, designated PCR9 and PCR11AAQ55054,055055), are found to contain sequences characteristic of grotein-linked receptors. Each fragment contains a single ORF. There is considerable similarity between rat sometostatin receptor and PCR11, suggesting that PCR11 is a novel sometostatin receptor subtype. Both fragments exhibit not only primary sequence similarity to other receptors but also the hydropathy pattern characteristic of G protein-linked receptors. The novel G protein-linked receptors are possibly of the peptide ligand subclass.

The invention relates to nucleic acid sequences (ABAB1529-ABAB1552) that encode Groupled protein-receptor related polypeptides as decombled protein-receptor related polypeptides (ABB44522-ABB4443). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the (GPCRX) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The colypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent GPCRX-associated disorders, especially in humans. For example, they can constant processing and metabolic pathway modulation (e.g. cobesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobesity, anorexia, davancers, neurodegenerative disorders, haematopoietic disorders, developmental diseases, neurological disorders, haematopoietic disorders, developmental diseases, neurological disorders, condetermine the presence of or predisposition to a disease associated control samples. They are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples or benefactors and/or agents
   New human G-protein coupled receptor X, GPCRX, polypeptide useful in treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists and
  modulating cellular polypeptide expression or activity, useful as
antagonists and agonists in disease treatment.

The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful for diagnosing and treating diseases or conditions mediated by human proteins are also proteases. Such diseases include hyperpoliferative disorders (e.g. hyperplasia), neurological disorders (e.g. parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders (e.g. distress syndrome, ARDS). The GPCR protein is also useful for identifying a modulator of the expression of the protein. It also serves as a target for identifying agents for use in mammallan therapeutic applications, c.g. a human drug particularly modulating a biological or pathological response in a cell or tissue that expresses the protein, in biological cresponse in a cell or tissue that expresses the protein, in biological sasays. GPCR is also useful in diagnosing a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic analysis. The column creamer of the protein generally in the present columns of the invention.

   The sequence represents a human G-protein coupled receptor (GPCR), hRUP19. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.

   The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

20, 31-38, 40, 41, 53-60) and their coding sequences. The present

sequence is one such G protein-coupled receptor; GPCRs are also known as

c seven transmembrane receptors and function in signal transduction. The

nGPCRx coding sequences are useful for screening a human to diagnose a

disorder affecting the brain or a genetic predisposition, specifically

c chizophrenia. nGPCRx are useful for identifying compounds useful for

treating schizophrenia. Detection of nGPCRx in a sample is useful as a

diagnostic tool for diseases or disorders e.g. thyroid disorders, renal

fallure, rheumatoid arthritis, CNS disorders, infections such as HIV-1,

metabolic and cardiovascular diseases, proliferative disorders and

c reating neurological disorders, including schizophrenia, ADHD/ADD

c treating neurological disorders, including schizophrenia, ADHD/ADD

c (attention deficit hyperactivity disordery attention deficit disorder),

and neuronal disorders such as Alzheimer's disease, Parkinson's disease,

migraine and senile dementia. Additional disorders include inflammatory

conditions (e.g. Crohn's disease), rheumatoid arthritis, autoimmune

diseases e.g. inflammatory bowel disease.

The invention relates to nucleic acid sequences (ABA81529-ABA81552) that encode (2-coupled protein-receptor related polypeptides (ABB4452-ABB44543). The isolated polypeptide having a sequence differing by no more than 15 % of anno acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the (GPCRX) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The colypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent CFC GPCRX-associated disorders, especially in humans. For example, they can GPCRX-associated disorders, especially in humans. For example, they can cardiant anorexia), diabetes, osteoporosis, crohn's disease, multiple colopsity, anorexia, distances, neurodegenerative disorders, alsease, parkhnson's disorders, Huntington's disease, immune disorders, haematopoietic disorders, developmental diseases, neurological disorders, haematopoietic disorders, developmental diseases, neurological disorders, condetermine the presence of or predisposition to a disease associated control samples. They are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples or predisposition or activity.
revention of GPCRX associated disorders e.g. or atherosclerosis, and to screen for antagonists and
  (e.g. cellular receptors or downstream effectors) and/or ayents modulating cellular polypeptide expression or activity, useful as antagonists and agonists in disease treatment.

   4;
   The sequence represents a human G-protein coupled receptor (GPCR), hRUP55. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settlings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles those receptors play in the human condition, both normal and diseased.
   Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743-AAY90677 and AAA30709-The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino cids N-terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or AA,15-Pro. The endogenous amino acid is selected by His, Arg or preferably Alas position is Lys, this residue is replaced by His, Arg or preferably Alas position is Lys, this residue is replaced by His, Arg or preferably Alas constitution acid and the Promay be endogenous ron-endogenous, or a mixture of endogenous and con-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research is setting diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous continued the acceptor in autant and any active, they can be used directly for screening of compounds without the need for endogenous continued the acceptor and AAY90603-Y90687 the mutant the acceptor and AAY90677 and AAY90687 the mutant

  dementia. The invention also provides genetic screening procedures that entail analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR's. The present sequence is human CON103 G protein-coupled receptor (GPCR) protein.
  The invention relates to human G protein-coupled receptor (GPCR) and their corresponding DNA molecules. GPCR is also referred as seven transmembrane receptor. G protein-coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating schizophrenia. These compounds are also useful for treating other neurological and psychiatric diseases, e.g. depression, anxiety, bipolar disease, affective disorders, attention deficit hyperactivity disorder, attention deficit disorder, parkinson's disease, migraine and senile neurosis, Alzheimer's disease, Parkinson's disease, migraine and senile
  Seven transmembrane receptor polypeptides and polynucleotides, useful for treating neurological or psychiatric disorders, e.g. schizophrenia, as well as for identifying compounds useful for treating schizophrenia

This is the amino acid sequence of a novel human G protein coupled receptor, designated HEOAD54, as deduced from a cDNA clone (see AAX06947) isolated from an eosinophil library. A method is claimed for diagnosing susceptibility to disease resulting from mutation of the HEOAD54 gene or imbalance in HEOAD54 polypeptide expression levels. HEOAD54 apointsis/antagonists can be used to activate/inhibit used to prevent expression, while administration of HEOAD54 is used to prevent expression, while administration of HEOAD54 is used to treat conditions associated with a lack of HEOAD54 polypeptide expression. HEOAD54 polypeptides can be administered directly or as a vaccine to inoculate against disease. Diseases diagnosed, prevented and treated include bacterial, immalist, protozoan and concerts, and infections, particularly HIV-1 or HIV-2 infections, pain, concerts, and expression.

   The present invention provides the protein, cDNA and genomic DNA sequences of human G-protein coupled receptor opioid-type receptor 1 (OTR1). The protein is involved in neurotransmission, and the sequences can be used in the treatment of OTR1 related diseases. The present sequence is the OTR1 protein.

  hRUPII. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilized to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                     receptors for direct identification of candidate compounds as agonists, \boldsymbol{\cdot} inverse agonists or partial agonists for use as therapeutic agents \boldsymbol{\cdot}

The present sequence is a novel human cell surface receptor protein (HCSRP) designated HCSRP-6. The nucleotide sequence was identified in Incyte Clone 2851578 from the CDNA ilbrary BRSTYUTI3, which was made from preast tumour tissue. A number of Incyte Clones were used to assemble the consensus sequence. BLAST analysis showed that the sequence is homologous to rhodopsin-like GPCK/HM14 g219867 isoform 5507827. HCSRP and its antagonist are useful for preventing or treating disorders associated with decreased or increased expression or activity of HCSRP. Such disorders include cancers such as leukaemia and atheroma, immune disorders such as rheumatoid arthritis, asthma and atherosclerosis, bacterial and parasitic infections and neuronal disorders such as akathesia, Alzheimer's disease, multiple sclerosis and expensions to probes to diagnose these conditions. Anti-HCSRP antibodies may be used as antagonists, as a targeting or delivery mechanism for bringing pharmaceutical agents into contact with cells or tissues expressing texapility or immunogenic fragments are useful for drug screening using libraries of compounds.
   New human cell surface receptor protein and polynucleotide useful for diagnosis, prevention and treatment of cancer, immune disorders, infection and neuronal disorders

The greature intraction tendence to move to procedure tracepouts to GPCRX; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is the coding sequence for one such 6 protein-coupled receptor. Gequence is the coding sequence for one such 6 protein-coupled receptor. Getter also known as seven transmembrane receptors and function in signal transduction. The nGPCRX coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic screening a human to diagnose a disorder affecting the brain or a genetic compounds useful for treating schizophrenia. Detection of nGPCRX in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders and hormonal disorders. Modulators of diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRX activity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hypersactivity disorder/attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia.   The present sequence is a member of the G-protein coupled receptor (7TM receptor) family, designated the HM74A receptor. The proteins, agonists, antagonists and polynucleotides can be used for treating disorders associated with increased or reduced expression or activity of HM74A, e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, disbetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia,

The present sequence encodes a member of the G-protein coupled receptor (7TM receptor) family, designated the HW74A receptor. The proteins, agonists, antagonists and polynuclectides can be used for treating disorders associated with increased or reduced expression or activity of HM74A, e.g. bacterial, fungal, protozoan and viral infections.

C HM74A, e.g. bacterial, fungal, protozoan and viral infections.

C diabetes, obesity, anorexia, bulimia, astima, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, depression, delirium, dementia, and severe mental retardation, and dyskinesias such as Huntington's disease or discretices.
  HM74A receptor; G-protein coupled receptor; infection; pain; cancer; diabetes; obesity; neurological disorder; heart failure; hypertension; asthma; allergy; ss.
  New isolated G-protein coupled receptor, HM74A - used to develop products for treating e.g. infections, pain, cancers, diabetes, obesity, neurological disorders, heart failure, hypertension, asthma

The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

(28, 31-38, 40, 41, 53-60) and their codding sequences (see

28, 31-38, 40, 41, 53-60) and their codding sequences (see

AMENGO969-AAMESIOIS and AAMESIOS and AAG80929-AAG80975 and AAG80977). The

present sequence is an oligonucleotide, which was used in the present

invention. GPCRs are also known as seven transmembrane receptors and

threating a human to diagnose a disorder affecting the brain or a

conformation in signal transduction. The nGPCRx according sequences are useful

conformation in signal transduction. The nGPCRx are useful

conformation in signal transduction and isociting the brain or a

genetic predisposition, specifically schizophrenia. nGPCRx are useful

conformation in signal and in a diagnostic tool for diseases or

disorders e.g. thyroid disorders, renal fallure, rheumatoid arthritis,

closurders e.g. thyroid disorders, renal fallure, rheumatoid arthritis,

closurders, infections such as HIV-1, metabolic and cardlowsacular

conformation in disorders and hormonal disorders. Modulators of
